No items have been added yet! Related Collections. FULL Setup of Step 7 Automation License Manager (Reevaluate - Community Edition) on Activation Number.Q. Core Data - 1-to-many without key attribute I have one core data model, containing entities NamingType, Sort and NamingType can have many Sort and NamingType can have many Sort. NamingType has no attribute sort that is not updating. NamingType does not manage sorting for itself. Instead, Sort entity deals with that. Every Sort is associated with exactly 1 NamingType. My question is: How can I manage this in core data? Do I need to have another entity that has sort as attribute and that manages sorting? I'm afraid that I'd have to add another attribute that's not managed by the core data model, which would make my code more complex. How can I achieve this? A: You can have a property in the NamingType entity where Sort entities are assigned to, and an inverse relationship from Sort to NamingType. The real advantage of this approach is that it can be managed from one place, your Sort entity will call NamingType directly, in the event that the relationship changes. Basketball Championship: U16 Semifinal #1 Wednesday, November 30th, 2017 at 6:00pm A-State and A-Sun foes face off in the first semifinal match of f678ea9f9e
